

HTML Basic

Full Stack Web Developer
Session 2

Goals

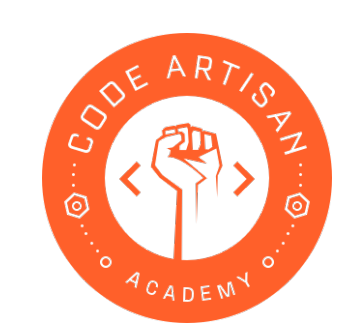

- Understand the HTML attributes
- Use some basic HTML elements: Images, Link

Anatomy of HTML Element

Key = “Value”

<p id=“intro”>...</p>

Job of HTML Attributes

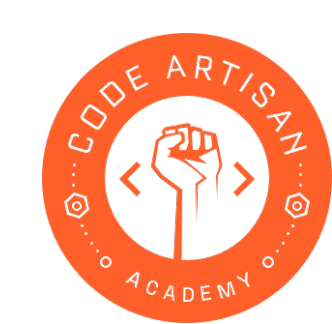

- Extend the HTML Tag, e.g. accesskey, loop, maxlength
- Add meta data to, e.g. id, class, name
- Some attributes are required, e.g. src, href
- Some attributes applied only to specific HTML tags
- You can have multiple attributes in a HTML tag

Attribute Extends Functionality

Some HTML elements can have some abilities with the use of attribute

- type="password" in input element makes the character become unseen as regular characters
- maxlength="10" makes input elements only accept maximum 10 characters
- target="_blank" in a link make it open the link in a new tab / window

Images

To add image to your HTML page use the following HTML tag

- ``
- Image tag doesn't need closing tag, the reason is that the image its self is the content
- Unlike other HTML tags, they format the content, that is why they need closing tag like `</p>`
- Image tag requires the attribute src, which tell the browser where to get the image from
- Source of image can be local from your own machine / server, or remote from other server. Remote location uses the complete url of the image such as <https://static01.nyt.com/images/2020/03/17/world/17virus-tabs-slide-2USB/17virus-tabs-slide-2USB-videoLarge.jpg>

Link

Link connect any content to another location or page. To create a link use the following:

- `About Us` or `Google`
- The first link goes to local page. The second goes to a remote page.
- A link has a default style: underlined and blue colored, or purple once it is clicked

Files Management

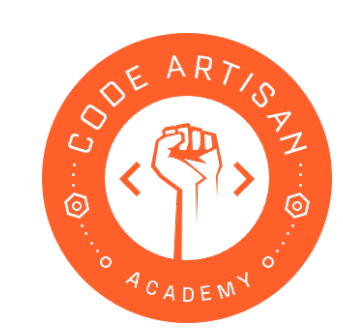

We need to organize our files in order to build our website. The common structure in a static website:

Files in HTML

- Some HTML tag need to refer files, such as images, another page for link
- The path can be either relative or absolute
 - `` the file photo.jpg is inside the folder images and that folder is in the same location as the file that has this img tag
 - `` the file is one folder above from the html file that is using this photo.jpg, so you need to go one folder up using ..
 - `` this is an absolute path, the file is in the folder images which is located in the root

Block & Inline

- Block break the line and push other content to next line, some examples are `<p>`, `<h1>`, ``, ``
- Inline can be nested inside block elements, some examples are ``, ``, ``, ``
- Not all block elements can have another block elements inside, you can not have `<p>` inside a `<p>` or you can't have `<h1>` inside `<p>`

Home Work

Create the page on the right.

Use this for the assets:
